### 1T126 Fitting Installation Instructions

- Cut the tube off squarely next to the hose fitting. At least 7/8" straight length is required and the outside diameter of the tube should be smooth and free from deep lengthwise scratches.
- To prevent cutting the inside of the O-ring, smoothly chamfer the outside diameter of the cut end 15° to 30°. Deburr the inside diameter.
- Remove the nut, compression sleeve, and O-ring from the fitting and lubricate the O-ring with a lubricant that is compatible with the refrigerant used in the system.
- Place the lubricated O-ring in the counterbore of the fitting.
- Slip the compression sleeve, small end, into the nut and assemble the nut on the fitting fingertight. Make sure the compression sleeve is not cocked in the nut. Back the nut off 1/6 to 1/3 turn (one to two hex flats).
- Insert the chamfered tube end through the nut into the fitting. If high resistance is felt when the end of the tube contacts the O-ring, remove the tube. The end of the tube may require a larger chamfer and/or the O-ring may require more lubrication on the inside diameter. Repeat the previous steps.
- Make sure the tube is bottomed in the fitting
  - tighten the nut finger tight
  - mark the fitting and nut hex indicating the starting point (see illustration) and
  - wrench tighten the nut 1 to 1-1/6 turns (6 to 7 hex flats).
- Later, if it is ever necessary to loosen the connection, re-assemble the nut 1/6 turn (one hex flat) after finger tight.
